# 1 Report

## 1.1 Introduction

This document presents all the important information regarding the TODO: TFG Full name-final degree project.

First, a report of the project is given. It functions as a general summary of the work done. The current and past situation in relation with the problem to solve are outlined, followed by briefly describing the proposed solution and the summary of the planning and budget.

Then, all the annexes are presented. They are geared towards the technical reader, and contain the initial documentation for the project, the complete system analysis and design, how the planning was elaborated, the studies related to the algorithms to be used for the implementation and finally the manuals for users and programmers of the final program.

The annexes are followed by the complete list of the requirements, functional and non-functional, and the internal and client budget breakdown.

Finally, the conclusions, future work and bibliography complete the document.

It is important to note that the organization of the contents for this document is done following the criteria and recommendations of the UNE 157801 norm for the development of information systems projects.

## 1.2 Purpose

This project aims to create a program that automates the process of assigning classrooms to all the groups of a given semester.

The implementation of this system is intended to assist in the work of the supervisor for this process, and provide an efficient and flexible tool that expands the possibilities of such work.

To do so, the program executes two algorithms, a genetic algorithm guided by a greedy algorithm. For a more detailed view on these algorithms the reader might refer to [2.4](#).

<b>Supervisors:</b> Raúl Mencía Cascallana, Carlos Mencía Cascallana		
<b>Date:</b> Appril 16 <sup>th</sup> , 2022	<b>Version:</b> 1.0	

Along with the system, the user and programmer manuals are submitted. These have the purpose of teaching how to use, maintain and extend the system.

### 1.3 Background

At the beginning of each semester, the School of Computing Engineering of the University of Oviedo opens a process in which the person in charge takes the list of groups for the semester, their schedules and the list of classrooms, and performs a manual compilation of all the assignments.

There are some other similar procedures, like the creation of the exam timetable or the assignments of enrolled students to subject groups. However, some are not manual, but automated by a system, like the previously mentioned procedure of assigning students to groups.

Seeing the potential of such tool, the author of this project was given the task of automating the assignment of classrooms to subject groups.

### 1.4 Description of the current situation

As explained in the previous section, the school has a supervisor for the process of assigning classrooms to groups.

This procedure is done after configuring the student groups for the semester and knowing their schedules.

Even though it is a manual process, the supervisor does not start making the assignments from scratch. First, they have the knowledge of previous years, and then they have a list of preferences or premade assignments. For example, certain laboratories can only be assigned to specific groups, like the ones from the Electronic Technology of Computers subject.

The system described in this document preserves these sources of information and builds on top of them.

## 1.5 Standards and references

### 1.5.1 Standards

*UNE 157801. General criteria for the design of information systems projects.* This standard is used for defining the structure and contents of this document. However, some sections have been added, removed or modified to fit the format of a final degree project. A conclusions chapter has been introduced to the general structure as well.

### 1.5.2 Licenses

The software of this project is licensed under the GNU General Public License v2.0.

### 1.5.3 Other references

*Java Code Conventions.* Set of guidelines and conventions for programmers to consider when using the Java programming language.

## 1.6 Definitions and abbreviations

Listed below is a glossary of definitions and abbreviations used in the document whose meaning may not be obvious.

Glossary of definitions:

- **Genetic algorithm:** metaheuristic search and optimization algorithm.
- **Greedy algorithm:** algorithm that builds the solution in successive steps, always trying to take the optimal solution for each step
- **Heuristic:** function that gives value to each path in a search algorithm, based on current information.
- **Java:** general-purpose, high-level, object-oriented programming language.
- **Metaheuristic:** high-level heuristic that guides the search in a combinatorial optimization problem.
- **Program:** The software described in this document.

- **System:** The software described in this document.
- **Technical reader:** used in this document as someone who knows about software engineering, but not necessarily about genetic or greedy algorithms.

Glossary of abbreviations:

- **CLI:** Command Line Interface.
- **GNU:** GNU is not Unix (recursive acronym). Refers to the free software project announced by Richard Stallman.
- **UNE:** in spanish, *Una Norma Española*. Refers to the Spanish Association for Standardisation.

## 1.7 Initial requirements

The requirements listed here are a basic overview of the fundamental functionality covered by the project. For the complete list of in-depth requirements the reader might refer to [3](#).

### 1.7.1 Interface

- The program must implement a CLI.
  - The CLI must show basic or complete information to the user depending on the given option flag.
  - The CLI must show the encountered errors to the user before terminating the execution.
  - The CLI must have help, license and version options.

### 1.7.2 Input

- The program receives as input the classrooms, groups, group schedule and the academic weeks of each group.
- The program might optionally receive as input a subset of assignments already performed.

TODO: TFG Full name		
Author: Hugo Fonseca Díaz		Page 6 of 13
Supervisors: Raúl Mencía Cascallana, Carlos Mencía Cascallana		
Date: Appril 16 <sup>th</sup> , 2022	Version: 1.0	

- The program might optionally receive as input a previous complete list of assignments but without some of the classrooms/laboratories used in it.
- The program might optionally receive as input a previous complete list of assignments but with more or less groups.
- The program might optionally receive as input a list of classroom preferences for the groups of a particular subject, given their type (theory or laboratory) and language (english or spanish).

### 1.7.3 Configuration

- Program configuration must allow the user to control the parameters of the genetic algorithm.
- Program configuration must allow the user to change the version of the program.
- Program configuration must allow the user to specify the routes for the log and output files.
- Program configuration can change in the middle of the course.

### 1.7.4 Algorithm

- The program must use a genetic algorithm guided by a greedy algorithm.
- Language groups requirements:
  - English groups should go to different classrooms/laboratories from the spanish groups.
- Classroom requirements:
  - Some initial classroom assignments can be specified before the execution of the program and they must remain the same.
  - The program must be able to find a gap in the current list of assignments to include a (mono/multi)-(classroom/laboratory).
  - The number of groups of the same number and course assigned to the same theory classroom must be maximised.

Author: Hugo Fonseca Díaz		
Supervisors: Raúl Mencía Cascallana, Carlos Mencía Cascallana		
Date: April 16 <sup>th</sup> , 2022	Version: 1.0	

- The number of groups of the same subject assigned to the same laboratory must be maximised.
- In each time slot there must be a minimum number of free laboratories.
- Some big laboratories must be empty for emergency reasons.
- The program must penalise assignments where the number of students is far below the number of computers.
- The laboratories must have some free space defined by the user.
- In small laboratories (of 16 computers) there must be at least two free computers.
- The program must be able to handle a split in two of a laboratory group with only one professor (for emergencies).
